An hour of reading at the library

Fictitious example created by Scanfile to review a translation. It does not contain data of real people.

The question

A library organized a reading activity for a week. One group read in a quiet room and another during regular hours. The goal was to observe the experience, not to prove that one room was better.

The results

In the quiet room, 12 people participated, and 9 finished the article. During regular hours, 15 people participated, and 8 finished it. The groups were not randomly assigned. These numbers do not demonstrate a cause-and-effect relationship.

Before sharing

Check the group names, figures, and limitations. Do not remove the word "no" or convert an observation into a definitive conclusion. Read the full text before quoting a sentence.
